
Checking Git Repository Status

Overview

This guide explains how to inspect the current Git branch and check the status of modified and untracked files in a repository.

Prerequisites

- ◆ A Git repository initialized or cloned on your local machine.

Step 1: Verify Active Branch [VERIFICATION]

Check which Git branch is currently active in the repository working directory.

```
git branch
```

```
* main
```

Step 2: Inspect Working Directory Status [VERIFICATION]

Display uncommitted changes, staged files, and untracked files to review the state of the repository.

```
git status
```

```
On branch main
Your branch is ahead of 'origin/main' by 1 commit.
```

```
Changes not staged for commit:
  modified:   flowscope.py
  modified:   flowscope_parser.py
```

Result

The active branch and repository state—including local commits, modified files, and untracked directories—have been successfully verified.
