
Checking Git Repository Status and Active Branch

Overview

This guide explains how to check the active branch and review the current status of tracked and untracked files within a Git repository.

Prerequisites

- ◆ Git installed and available in the system PATH.
- ◆ A local Git repository initialized in the current working directory.

Step 1: Check Active Branch [VERIFICATION]

List local branches to identify which branch is currently checked out.

```
git branch
```

Expected output:

```
* main
```

Step 2: Inspect Repository Status [VERIFICATION]

Check the state of the working directory and staging area to view modified files, untracked changes, and commit status relative to the remote branch.

```
git status
```

Expected output:

```
On branch main
Your branch is ahead of 'origin/main' by 1 commit.
```

```
Changes not staged for commit:
```

```
■modified:   flowscope.py
■modified:   flowscope_curator.py
■modified:   flowscope_parser.py
```

```
Untracked files:
```

```
■sessions/2026-09-16/Parser-Test-10/
■...
```

Result

The current active branch was verified as **main**, and the working tree status was inspected, revealing modified source files and uncommitted session directories.
